Usage in the CAD field has grown significantly over the years, with AutoCAD being used in many areas including architecture, engineering, and construction, as well as many types of industries, such as mining, oil and gas, automotive, aerospace, and automotive manufacturing. While AutoCAD is used by many to create 2D drawings, 3D drawings and models, and to display the drawings, the functionality and capabilities of the program itself may surprise many. While this is a guide for AutoCAD basics, the basics of AutoCAD were covered in a previous basic tutorial titled "How to use AutoCAD (2009)" AutoCAD is loaded into a work space, which acts like a desktop, or a separate work area for a user. The work space has multiple tabs that may be used to access different sections of the software and its associated features. The purpose of a work space is to make AutoCAD easy to use, by providing a separate area where all of the tools are accessed from. The benefits of this include, but are not limited to, the following: It allows the user to take advantage of multi-window and multiple work-area views. It allows the user to easily move between different parts of a drawing, and back and forth to other parts of the drawing. It allows the user to save tools, panes, window and workspace preferences, and work-area settings, so that they can easily get back to where they left off. It allows the user to save the workspace as a new work-space, so that if a drawing is already open in a user's work area, it does not have to be closed before opening a new one. The commands available within the work area have been organized into tabs. There are two main tabs, 'Home' and 'Toolbar'. These tabs include the Tools and the Options. The Home Tab The Home tab in the work area contains the following: General Save and Open Files Save As New Import Misc Help The 'General' tab contains all of the basic configuration settings for AutoCAD. 'Save and Open Files' provides options to save, open, and save as. 'Save As' allows the user to save a drawing to a file or folder. 'New' allows the user to start a new drawing file. '

GoPro Picks Up Reel of Video Sport Shoots Photos: From iPic. Alejandro Valladares Video: Ryan Ludwig Even as it's bringing its first action camera to market, GoPro is pulling in fresh video directors to help craft the first video content. The start-up introduced six "Creators Program" videographers at its suite of product launches at the New York International Auto Show. The GoPro-approved video directors will turn out custom content for the company. Their work will be released on the brand's site, where a video editor will create the final cuts. "Video is the next frontier in the GoPro experience," said GoPro CEO Nick Woodman, who was photographed with the crew. "With our powerful cameras, athletes will be able to capture stunning, unedited footage." GoPro will also tap away its partners, including Ford, to create videos. The automaker will outfit GoPro cameras to its vehicles to capture the challenges of touring the world's most scenic highways. The independent program will allow filmmakers to follow athletes and share their tales from the road, but it also will provide product info and tips. The program is the latest creative evolution for GoPro, which is selling its first action camera, the Hero 1/d647c40b

Menu Look! The World's First Drone Transformer! When it comes to the future of robotics, Darpa has big plans for the combat bots that could one day replace soldiers, and what better way to test out those bots than by transforming them into, say, boxy beasts that can fly through windows? That's exactly what Darpa does, with the Pentagon's Urban Challenge, an annual robot-meets-obstacle obstacle course that gives teams of humans and robots a chance to compete. Teams from around the world take the challenge. It's taken about 10 years of testing to get to this point, and Darpa recently took the wraps off the latest version of its robot. What makes this particular robot so special is its wings that let it fly, but also change into a series of truck-size form factors, including a humongous, truck-sized boxy shape. When the DARPA Robotics Challenge first started, the main goal was to see if robots could complete challenging tasks like opening doors and push heavy loads. But because Darpa's given the robots a ton of power, DARPA has actually tested out a whole slew of possible uses for the robot, like towing and firefighting, said Bruce Matsunaga, who works on the Urban Challenge. But when you combine a humanoid robot and a flying robot, there's all sorts of possibilities. A human first. When robot and human begin a match of Urban Challenge, the teams split up, with the humans going first. It's then up to the robot to try to navigate a series of obstacles and open doors. When it's the human's turn, they have to go up against the robot — and this is the interesting part. In practice, the robot is controlled by a human, who can either control it directly or remotely through a screen. To complete a task, the human sets a specific goal and commands the robot to complete it, while also navigating the obstacles it's faced with. For the robot, it's important to understand what the human wants from it, because if it understands the goals of the human, it can do a lot of the thinking for them. But if it doesn't, the human can just tell it to "take my money" and the robot can "follow" a human through a wall. This

What's New in the AutoCAD?

New: Markups in Excel: Create your own custom data fields in Excel and import them into your AutoCAD drawings. (video: 1:55 min.) Drawing Data Masks: Add data masking to all the elements in a drawing, or select one or more elements to add masking to. Dynamic data masks keep only the most important information visible, and present only the data you need. (video: 1:30 min.) New in Parametric and Graphics: Revise your designs with parametric or graphic components. Support parametric components that create automatically if they exceed a certain size or require additional parameters to modify. (video: 1:07 min.) Enhanced: Editing tools: Markup Assist: Use a paper clip or a polyline to quickly mark up an image, and send changes directly to your drawing. (video: 2:02 min.) Make dynamic marks without a mouse: Use a laser pointer or electronic pen to make dynamic marks without a mouse. (video: 1:17 min.) Revise existing lines or curves, then accept changes from the drawing surface. Make dynamic marks without a mouse: Use a laser pointer or electronic pen to make dynamic marks without a mouse.
