Microsoft Paint, the official photo editor for Windows 95 and later, is similar to Photoshop in that it enables you to combine digital images in various ways. Microsoft Paint is included in every edition of Windows 10 and is a very basic tool that's most useful as a oneapplication means for doing basic image-editing tasks like cropping, compressing or enlarging, and adding an overlay. Bringing CMYK into the Pixel world You may have heard the term CMYK, which stands for Cyan, Magenta, Yellow, and Key. The original printer color-processing system is CMYK because all four colors — cyan, magenta, yellow, and black (sometimes also referred to as CMYK in the printing industry) — are processed. In the computer world, however, images have only one color (unless you're printing something), and that color is RGB, also called, by some, RGB color values. When you bring an image from the computer over to the printer to print, you should make sure that when the printer asks for the CMYK values (which are in numerical form because these values are represented by numbers rather than colors), it's using the numerical CMYK values rather than the RGB values. The conversion can look strange at first, but it's really pretty simple. You can bring images in RGB for m the computer or from another application, convert them to the CMYK form in Photoshop, and save them for print. After you print, you can create a new version and save it as RGB if you want to. You can also use an application that allows you to have multiple channels (such as RGB or CMYK) as well as transparent layers. You can view the CMYK values for an image in a color-managed workflow. Open the Layer Panel by clicking the Layer Menu and choosing Layers. Then, when the Background layer is selected, click the little Layer Info/Background Info button (the one with the three small squares) on the right side of the button bar. A tiny box will open up with the CMYK values for the current document. Multiple channel applications, conversion a breeze. If you're using Photoshop

Sensex, Nifty finish day almost flat The National Stock Market closed higher today with Sensex and Nifty ending almost flat after a choppy session, as tech names such as Tata Motors and Oyo hotels was mixed news, while ONGC rallied with the fuel inventory data. The BSE Sensex was up 0.16 percent at 37,817 and the Nifty at 11,145 was down 0.02 percent. The market breadth was weak as 1340 stocks declined while 980 closed higher. Mining stocks led the way higher, with OIL pulling up 30 percent. At 2918.80, Gold prices are up for five consecutive sessions. Orissa and Cochin Bank were also in the green. The market had given a cautious start with losses in most sectors before correction in the last hour. Tech and banking stocks led the rise. The banking sector started the day with a flight to safety after the fraud at YES Bank. The sector fell for a second straight session. Indian Overseas Bank lost 2 percent after it informed BSE it was considering de-listing its shares. Energy, metal and auto stocks were also under pressure due to weak global cues. Tata Motors, ONGC, Adani Ports, ITC and Ola were also in red. Among gainers, TCS, Infosys, ICICI Bank, ONGC and Axis Bank rose 1.1, 4.5, 1.8, 1.5, 1.7 and 1.2 percent, respectively. Upside gains in overall demand as well as in international trade, with protectionist measures creating uncertainty, has prompted the Reserve Bank of India to cut its policy rates by 25 basis points, while oil prices have gained more than 10 percent. At 12:31 pm, the Sensex traded 145.71 points or 0.16 percent higher at 37,817.42, while the Nifty was down 0.02 percent or 37.86 points at 11,145.80. Sectorally, all major sectoral indices were trading in green, except for the banking, auto and oil and gas stocks. The BSE-adjusted Nifty Nifty Bank, Media, IT and healthcare indexes were down 0.4, 1.9, 0.8 and 0.7 percent, respectively. Downside support for the market came from tech stocks and telecom, which fell for a second straight session. Oil & Gas,

It sounds like magic: Less expensive to stay in touch, than send a postcard? And you can do it at a digital rate. More than a third of all mobile phones are now digital, and in today's digital world, a phone a simple device and a long-distance phone conversation is no more expensive than sending a quick tweet. (MORE: Facebook Phone: New Venture from Apple, Microsoft and EBay?) There's some literature from the U.S. and Britain that claims the value of mobile phones to rural communities is actually getting lower because people are staying connected through cheaper, if slower, means — text messages. Still, lots of the literature, including a study from a relative newcomer — Singapore — suggests that the cost of communications is changing, and it's changing in a subtle and potentially important way. "Every technology change has the potential to be good or bad, and the divide in our current study is where technology is so easily accessible that its benefits are being discounted," explains JeeYoon Choi, a postdoctoral research fellow who did this study as her dissertation. Choi and her advisor, Kenneth Green of the University of Waterloo, in Canada, wanted to know whether it's a good thing, or a bad thing, for people to communicate in this way. "If yone were to talk on the phone while scanning text messages on the computer, one could save the cost of the phone call by getting text messages from people," share to talk by phone than to text. "If one were to talk on the phone while scanning text messages on the computer, local save the cost of the phone call by getting text messages from people," share to use the cost of the phone call by getting text messages from people," share to task by easys. "In contrast, if people were to text while browsing social metions its, they would save the cost of the phone call by not having to access the phone." (MORE: Google Glass: Coming to the Social Network?) And that, she says, is what she found. Among adults living in the U.S., people who text most often were less likely to use th
