Don't forget the image-editing basics To edit a photo, be sure to apply the following base rules to ensure that your image is usable: \* \*\*Zoom in.\*\* For both inkjet and film images, you need a zoom ratio between 1:1 and 2:1 to show detail in the image. When you're dealing with a small photo, you have to zoom in to 1:1 to 1:3 to be able to edit it properly. On top of that, some of the most attractive images on your computer screen are \_original\_ at the base zoom level of 1:1. \* \*\*Zoom out.\*\* All of your images have a natural \_zoom\_factor\_ to them. For example, a 36-inch by 48-inch photograph can be viewed at an original resolution of 2560 x 3200 pixels. If you zoom in by a factor of 4 or 16, the original photo shows you only a portion of the original image. This zooming is the base operation to work with for any zooming in and out in your image. A simple rule for editing is never to zoom out of your image. If you want to show more of the image in the final print, enlarge the photo to the size of the print. If you want to show a smaller view of the original image, zoom in on the photo as close as you can go to 1:1 and still see the whole image.

Q: Saving jpeg images fails I'm trying to save a jpeg image saved as a bitmap data in c# but for some reason the save fails. This is my SaveImage code: BitmapData bmpData = bmpPicture.LockBits(bmpPicture.Extent, ImageFormat.Jpeg, bmpPicture.PixelFormat); try { Bitmap bmp = new Bitmap(bmpPicture.Extent.Width, bmpPicture.Extent.Height, bmpData.Stride, bmpData.Stride, bmpPicture.Palette, bmpData.Data); bmp.SetResolution(bmpPicture.Extent.Width, bmpPicture.Extent.Height); bmpPicture.UnlockBits(bmpData); using (MemoryStream ms = new MemoryStream()) { bmpPicture.Save(ms, ImageFormat.Jpeg); FileStream fms = new FileStream(imgPath, FileMode.Create, FileAccess.Write, FileShare.None); ms.WriteTo(fms); fms.Close(); } } catch (Exception ex) { MessageBox.Show("Failure: " + ex.Message); } the messagebox shows the correct height and width for the image, but it ends up with the following error message: Write of 264 bytes was aborted: Stream was not writable. Any help is appreciated A: The problem is that the LockBits operation has returned an incorrect Bitmap. The Bitmap returned by LockBits always has only 1 plane. If the BitmapData contains a plane, then it is used by LockBits. But if the BitmapData is not used by LockBits, then it is set to white (rgb(255, 255, 255)). That means that your picture contains 2 or more planes. But the LockBits operation is not able to fix that. It will only try to map the pixel data to a single plane.
