the gom inspect suite 2020 also offers system-independent evaluation software for 3d measuring data generated by fringe projection scanners, laser scanners, coordinate measuring machines and other measuring machines. users can work with polygon meshes, inspect measuring data and produce reports as easily and efficiently as ever. paid modules like gom inspect professional support parametric inspection and simplify the entire measurement

workflow through templates for measuring procedures and inspection reports (smart teach functions). free gom inspect: full gd&t analysis functions are available. trend, spc and deformation analysis trend analysis helps monitor manufacturing and production trends to detect and prevent possible issues. this feature examines and reports the change in shape and morphing of geometry. these essential software tools are utilized to better understand manufacturing processes for a faster root cause analysis. with the softwares

parametric inspection functionality these features can be applied to multiple data sets. this allows for full-field evaluation of several parts or stages within a single project and offers functionalities for determining statistical analysis values such as cp, cpk, pp, ppk, min, max avg and sigma. the technique allows continuous measurement in real time, from start to end of a scan, without using predefined measuring plans and on measured, unstructured parts. it provides meaningful inspection results: deviations, defect types, scanning conditions, and other

relevant data. it is the ideal solution for the traceability of the whole process from creation to final results. from one measurement to the next, each element is traced back to the origin. the inspection parameters and the pre-selection of measurement points are traceable and documented by the scan. 5ec8ef588b
