Adobe made quite a few bucks by selling Photoshop to the masses. The following list features the most significant improvements made with the latest software, alongside the usual feature additions you can expect: All of this isn't particularly new. But Adobe's Sketch app on the iPad Pro has made light of the problems of OS X's lack of an Animator screen, has given us an app that lets us draw with the Pen and even share what we draw in the cloud. It's surprising, truly amazing, and absolutely (in my opinion) Google Drawings Code's killer feature. The ability to bring Photoshop to the iPad Pro is far from a perfect solution, however. I don't have an Apple Pencil yet, so I tried using it on the iPad Air's screen and it just didn't work quite as well as you might hope. I tried to take a realistic perspective drawing of a beach scene and the sketch pencil would often not register a command when I really wanted it to. I was able to figure out that this basically involved a couple of sections of the physics, but I am not sure that it was being performed as I hoped. Autosave can also be a bit clunky sometimes: I tend to use the dedicated save with Undo, so that I know that if my iPad is sent flying my photoshop components will be together. On older Mac desktops or laptops, I used to export the image to a folder, and then out went the sketch, but Photoshop just wasn't for that kind of work. I can imagine that someone who draws on his tablet for a living would interact with it in a much different way.
