Field of the Invention The present invention relates to a method of preparing a thermosetting resin composition having an excellent handleability and moldability. 2. Description of the Prior Art In recent years, an acrylic resin obtained by a reaction of an acrylic monomer and an epoxy compound, and a urethane resin obtained by a reaction of a polyol and an isocyanate compound are increasingly used as an adhesive. However, the acrylic resin and the urethane resin have a glass transition temperature lower than that of the thermosetting resin, and thus have a disadvantage of low heat resistance. A method of preparing a thermosetting resin by reacting a polyurethane prepolymer with a polyamine is known as a method for improving the heat resistance of the acrylic resin and the urethane resin. However, when the thermosetting resin is prepared by such a method, a high level of heat resistance can not be achieved. In order to prevent a reactive group from being hydrolyzed in an alkali solution, it is disclosed in Japanese Laid-Open Patent Application No. 6-296992 that after a polyol and an epoxy compound are mixed, the mixture is reacted with an amine in the presence of a catalyst. However, when the reaction is conducted at a high temperature, the viscosity of the mixture increases, so that the mixture does not have a desired viscosity. Furthermore, when the viscosity of the mixture is reduced, the reaction temperature must be lowered to maintain the viscosity.eBook Helping People Find Happiness We are an Online Service Provider. mp3 compressor 1.1 serial number. While the drive for higher efficiency, low cost and increased size at higher power levels is common to most electrical devices, many power supplies become highly inefficient as power increases. A typical power supply may have a load and input power factor of about 0.9 (i.e., 90% efficiency) and draw about 200 or more amps from the input power source at low power levels. However, the efficiency is often degraded at higher power levels. For example, efficiency may drop to about 40% at higher power levels. As electrical devices use more power, the inefficiencies of power

supplies become even more of a problem. One approach to power supply efficiency at higher power levels is the use of a switching power converter. For example, a two-phase buck converter can produce 200 watts at 90% efficiency, which can be increased to about 400 watts at 96% efficiency, and about 600 watts at 99.9% efficiency. Such a converter can provide the power source for a typical adapter plug.

Unfortunately, switching power converters are expensive, since they are typically packaged as separate power supplies from other components of the electrical device. For example, these power supplies are typically assembled as an add-on module in the electric device. Apple introduces the New iPhone 4S! Apple has announced the introduction of a new iPhone 4S. The new iPhone 4S comes with a redesigned back, a new music player feature, a new dock connector, the same 8 megapixel camera as the original iPhone 4, a faster A5 processor, 4G LTE support, iOS 5, a springboard feature, and lots more. The new iPhone 4S comes in 16 gigabytes, 32 gigabytes, and 64 gigabytes. The 16 gigabyte model costs \$199, the 32 gigabyte model costs \$299, and the 64 gigabyte model costs \$399. The new iPhone 4S

will be available in the United States, Canada, France, Germany, Japan, Puerto Rico, Singapore, and the United Kingdom starting on October 14. For those who want to use the camera features on their iPhone 4S, that's a big deal. Apple now has an iPhone lens attached to the back of the phone. It's on a special film that's attached to the iPhone 4S. To take pictures and video with the lens, you have to use the camera button and the record button simultaneously.
