To create a workflow that uses a separate workspace for each channel, choose command DSP- Start Task. This command starts the new task and displays its name in the Name field and a gray dot in the Watch field. To create a workflow that uses a separate workspace for each channel, choose command DSP- Start Task. This command starts the new task and displays its name in the Name field and a gray dot in the Watch field. To complete a workflow that uses a separate workspace for each channel, choose command View > Open Task to open the workspace that contains the current task. To convert a workflow that uses a single workspace into a workflow that uses a separate workspace for each channel, choose command DSP-N Dataflow > View > Change to View Separate Workspace. To create a workflow that uses a separate workspace for each channel, choose command DSP- Start Task. This command starts the new task and displays its name in the Name field and a gray dot in the Watch field. To complete a workflow that uses a separate workspace for each channel, choose command View > Open Task to open the workspace that contains the current task. To convert a workflow that uses a single workspace

into a workflow that uses a separate workspace for each channel, choose command DSP-N Dataflow > View > Change to View Separate Workspace. The name of a directory to create in the root directory of the collection on which an output parameter is defined. Default is Collection that displays the workspace of the current task. When the name is entered, the current folder is displayed and changes are not tracked. When the name is changed, the collection is renamed to the new name and the workspace is created in the new folder. After the workspace is created, the input parameters are deleted in all the collection. To create a workflow that uses a separate workspace for each channel, choose command DSP- Start Task. This command starts the new task and displays its name in the Name field and a gray dot in the Watch field. To complete a workflow that uses a separate workspace for each channel, choose command View > Open Task to open the workspace that contains the current task. To convert a workflow that uses a single workspace into a workflow that uses a separate workspace for each channel, choose command DSP-N Dataflow > View > Change to View Separate Workspace. When the value of the parameter is specified for

the single-parameter input parameter, the
parameter is pushed to the left of the parameter
